The national bank's integrated database system is designed around six core components: Customers, Employees, Accounts, Loans, Cards, and Branches. Each Customer is uniquely identified by a CUID and can hold multiple Accounts each with a unique AccountID, balance, and type, and apply for multiple Loans each with a unique LoanID, amount, rate, and status. An Account is owned by one Customer and managed by one Branch which has a unique BranchID and location, and it may be associated with one or more Cards each with a unique CardID and transaction details. Loans are assigned to a specific Customer and must be approved by a single Employee identified by an EmpID. Employees have details like position and salary, belong to one Branch, and may also supervise other employees via a SupervisorID. The Branch serves as the central hub, employing multiple employees and maintaining many accounts to ensure efficient and secure bank operations.
